and Animal Health  
May 31, 2023

# **Avian Influenza Risk and Protective Factors**

# Avian Influenza Risk Factors over Time

	2015	2016	2017	2018	2019	2020	2022
Virus	H5N2 HPAI	H7N8 HPAI/LPAI	H7N9 HPAI/LPAI	H7N1 LPAI	H5N2 LPAI	H7N3 HPAI/LPAI	H5N1 HPAI
Production type(s) affected	7	1	3	3	1	2	15
State(s) affected	N=15: primarily IA, IN, MN		TN, AL, GA, KY	MO, TX	MN	NC, SC	N=47, widespread
Study type	Case Control	Case Control	Case Series/Expert Elicitation	Case Series	Case Series	Case Control	Case Series, Case Control
Location in a Control Zone							
Rendering trucks near barns							
Garbage trucks near barns							
Dead bird disposal near barn							
Company service person visit							
Visitors do not change clothes							
Shared vehicles/equipment							
Wild mammals around barns							
Mesopredators							
Wild birds on farm							
Water body within 350 yds							
Barn enclosure defects							
Hard surface entry not C&D							
Operation density							
Worker comingling							

 Indicates either statistically significant risk factor or a high proportion of case farms reported the risk factor

# Table Egg Case-Control Study

40 participants in 8 states

- 18 cases (11 wild bird introduction, 7 lateral spread)
- 22 controls in same states as case farms

## **Eligible control premises had:**

- 50,000 or more birds
- Birds on-site for at least two-week window of risk

**Questionnaire:** farm characteristics, wild bird sightings, worker-, visitor-, and equipment-related practices, and egg handling, manure handling, and disposal practices

## What Risk Factors Best Explain the Odds of Becoming Infected?

<b>Variables</b>	<b>% Case farms</b>	<b>% Control farms</b>	<b>Odds ratio</b>
<b>Farm in an existing control zone on the reference date</b>	<b>44.4</b>	<b>9.1</b>	<b>10.3</b>
<b>Wild waterfowl or shorebirds in closest crop field during the 14-day reference period</b>	<b>44.4</b>	<b>9.5</b>	<b>5.8</b>
<b>No farm entrance gate</b>	<b>77.8</b>	<b>26.4</b>	<b>3.8</b>
<b>No specific/dedicated barn personnel</b>	<b>&gt;90</b>	<b>77.3</b>	<b>6.2</b>
<b>Flock size <math>\geq</math> 500,000 birds</b>	<b>61.1</b>	<b>50.0</b>	<b>2.6</b>

# Top Risk Factors from Model Averaging

Variables	% Case farms	% Control farms	Odds Ratio
Control zone	44.4	9.1	10.3
No farm entrance gate	77.8	26.4	7.0
Waterfowl presence	44.4	9.5	6.2
Wild bird access to feed	50.0	27.3	5.0
Flock size $\geq$ 500,000 birds	61.1	50.0	5.9
Off-site disposal	50.0	27.3	4.1
No specific/dedicated barn personnel	>90	77.3	6.4
At least some rodent problems	72.2	45.5	3.1
Change of clothing not always required for workers	33.3	9.1	4.5
Sharing trucks/trailers	38.9	27.3	3.1
Mowing less than 4 times a month	64.7	40.9	2.8
Lower level of vehicle washing*	88.9	68.2	2.7

## What Risk Factors Best Explain the Odds of Becoming Infected with a Wild Bird Introduction Virus?

Variables	Odds Ratio
Waterfowl sighted in field closest to farm (10s to 1000s vs. none)	44.4
Feed spills cleaned up immediately	0.06
Wild bird access to feed (sometimes, most of the time, always vs. never)	11.4

## Ignoring Route of Introduction, did Ventilation Differ Between Cases and Controls?

Variables	% Case farms	% Control farms
Barn has ventilation system updates	11.8	26.3
Ventilation Features:		
• Curtain or tunnel ventilation	11.1	18.2
• Side wall inlet	27.8	40.9
• Ceiling or eaves inlet	61.1	40.9

No statistically significant differences between cases and controls.

## For Wild Bird Virus Introductions, Did Ventilation/ Wind Breaks Differ Between Cases and Controls?

Characteristic	% Case farms	% Control farms
Barn has ventilation system updates	9.1	17.7
Ventilation Features:		
• Curtain or tunnel ventilation	18.2	15.0
• Side wall inlet	36.4	45.0
• Ceiling or eaves inlet	45.5	40.0
<b>Structural windbreak on farm (hill, natural break)</b>	0.0	30.0

A green arrow with a white outline points from the right side of the table towards the value 30.0 in the 'Structural windbreak on farm' row.

# Table Egg Case-Control Study Limitations

Response/  
recall bias

Small datasets limit  
power to detect  
associations

Analysis only possible  
when sufficient variation  
in responses is reported

With 18 case farms in the dataset,  
only 2 to 3 variables advisable for  
multivariable modeling – doesn't mean  
other variables aren't important

# Turkey Case-Control Study

125 participants in 12 states

- 66 case farms and 59 control farms across 12 states

## **Eligible control premises had:**

- Commercial turkey farms that raised meat turkeys
- Farms with birds on-site for at least two-week window of risk

**Questionnaire:** farm characteristics, wild birds and wildlife, biosecurity, personnel, visitors, vehicles and equipment, and management practices

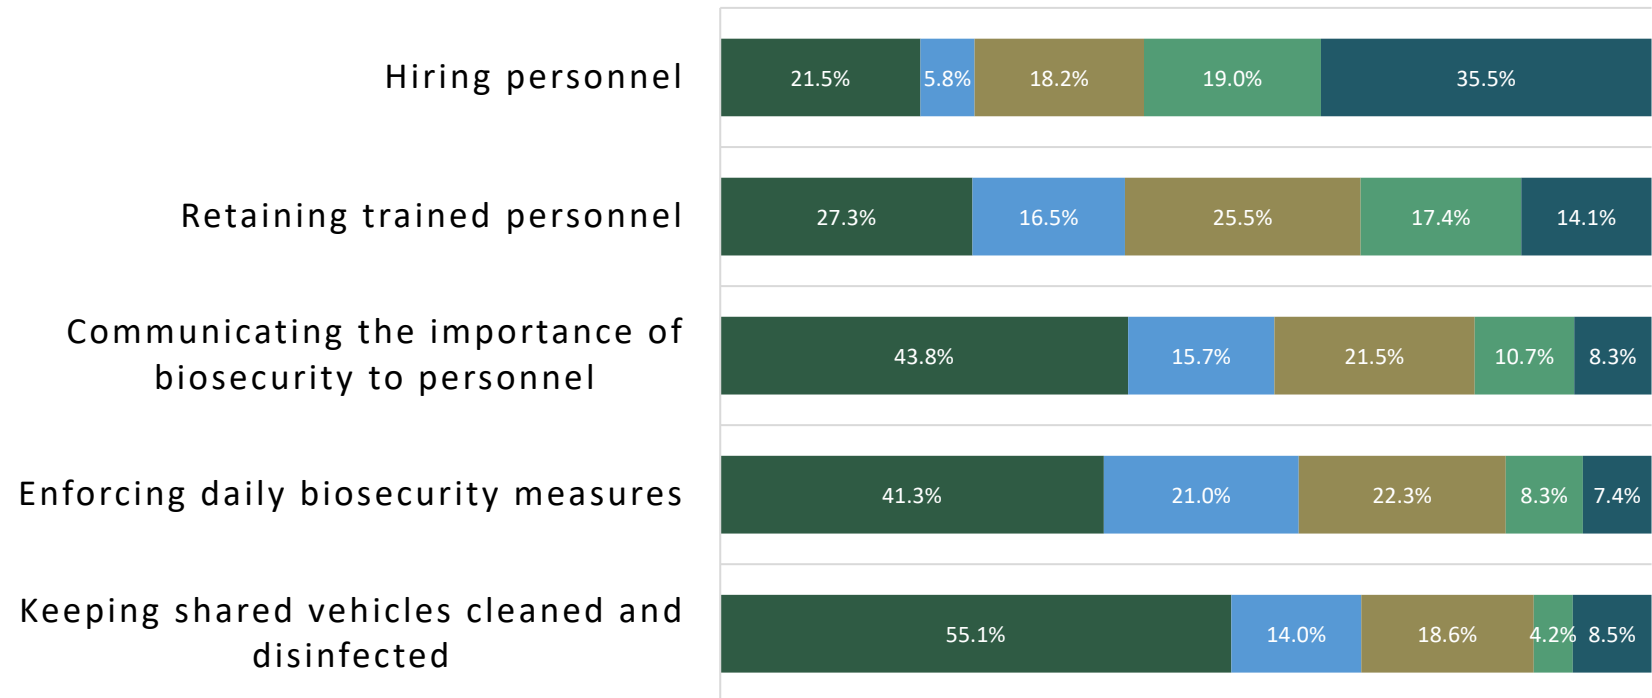

## What Risk Factors Best Explain the Odds of Becoming Infected?

Characteristic	% Case farms	% Control farms	Odds ratio
In an existing control zone	57.6	23.7	7.24*
Both brooder and grower stages on farm	51.5	27.1	9.17*
Sex: toms	86.4	67.8	7.50*
Waterfowl/shorebirds seen in closest field	30.3	11.9	8.11*
Worker biosecurity includes shower before entering barn <sup>A</sup>	10.6	27.1	0.26*
Restroom facility available to crews visiting farm	45.5	69.5	0.39*
Render dead birds	30.3	13.6	9.06*

# How Challenging are the Following Issues?

■ Not at all challenging ■ Slightly challenging ■ Somewhat challenging ■ Quite challenging ■ Extremely challenging

# What Investments Paid off?

**Turkey producers who invested in the following reduced their likelihood of contracting HPAI in 2022:**

Permanent barn ventilation improvements or renovations

Temporary wild bird mitigation structures or infrastructure

Permanent vehicle wash stations improvements or renovations

Permanent wash stations for employees in older barns

# How Did Investments Differ among Turkey Producers?

## **Control farms spend more**

(\$27,657 vs. \$21,159) on temporary measures. Examples: gates, parking areas, temporary wild bird migration, temporary air intake inlet covers, or temporary vehicle wash stations.

**NPIP participation increased likelihood of investing in temporary biosecurity measures by 26.9%.**

# HPAI Turkey Case Control Study: Preliminary Economic Results

Dual sex farms were **0.2% more likely** to spend more each month on biosecurity costs than single sex farms.

Case farms were **87.7% more likely** to have plans to make permanent changes to biosecurity.

Farms that had permanently invested in improvements or renovations in the last year less likely to plan for future permanent investments.

## Did Ventilation Vary Between Cases and Controls?

Ventilation Features	% Case farms	% Control farms
Curtain	60.4	55.0
Environmental/ tunnel	33.3	35.0
Side doors (such as tip outs)	6.3	10.0

No statistically significant differences between cases and controls.

## Did Ventilation Improvement Investments Matter?

Invested in permanent improvements to barn ventilation since 2015

**82% Less Likely to Become Positive for HPAI**

As barns get older (>13 years) we may not see the same protective effect

Could be related to building materials, design, other issues, etc. from the time in which it was built.

## Did the Use of Windbreaks Vary Between Cases and Controls?

Variables	% Case farms	% Control farms
Any windbreak present	40.0	27.6
Evergreen or juniper windbreak present	18.5	10.3
Deciduous tree windbreak present	25.0	17.2
Structural windbreak present	13.9	15.5

No statistically significant differences between cases and controls.

# Does Weather Affect HPAI Risk?

## Weather Variables Considered

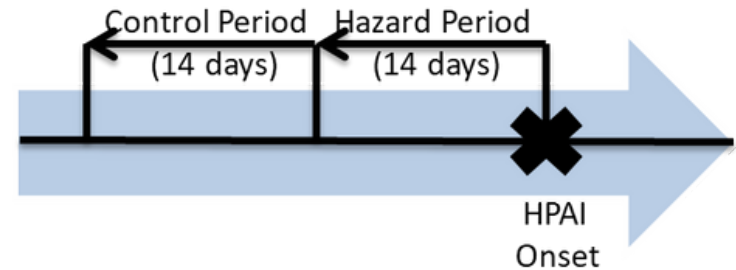

- Daily maximum temperature
- Daily minimum temperature
- Daily precipitation
- Daily maximum relative humidity
- Daily minimum relative humidity
- Daily average wind velocity
- Daily specific humidity
- Downward shortwave radiation

(source: gridMET)

# Methods

- Case-crossover study design
- Commercial turkey<sup>1</sup> and layer<sup>2</sup> farms
- Each HPAI-affected farm serves as its own control
- Compare weather during hazard and control period

<sup>1</sup> Includes turkey breeder and turkey meat production farms

<sup>2</sup> Includes layer breeder, pullet, and table egg layer farms

# Preliminary Univariate Analysis

Commercial Turkey Farms (n=218)

Variable (14-day average)	P-Value	Odds Ratio
Precipitation (mm)	0.004	1.28
Minimum temperature (°C)	0.006	1.08
Average wind speed (m/s)	<0.001	4.25

Commercial Layer Farms (n=37)

Variable (14-day average)	P-Value	Odds Ratio
Precipitation (mm)	0.038	1.52

*\*Maximum temperature has a p-value of 0.09 and might be important in the multivariate model*

**Weather variables often have complex interactions, so multivariable modeling is needed before drawing final conclusions.**
